

Palindrome Checker Scripts

This document contains simple script solutions to check if an entered string is a palindrome. A palindrome is a word or phrase that reads the same backward as forward (for example: `gfg` or `racecar`).

Solution 1: Linux / Unix Shell Script (.sh)

Use this solution if you are running on Linux, macOS, or Git Bash / WSL on Windows.

The Code (check.sh)

```
#!/bin/bash

# Ask the user for input
read -p "Enter string: " str

# Reverse the string using the 'rev' command
rev_str=$(echo "$str" | rev)

# Check if they match
if [ "$str" == "$rev_str" ]; then
    echo "It is a palindrome."
else
    echo "It is NOT a palindrome."
fi
```

How to Run It:

1. Save the code above into a file named **check.sh**.
2. Open your terminal and give the script execution permissions by running:
`chmod +x check.sh`
3. Run the script:
`./check.sh`
4. Type your string (e.g., `gfg`) and press Enter.

Solution 2: Windows PowerShell Script (.ps1)

Use this solution if you are running natively on Windows using Windows PowerShell or PowerShell Core.

The Code (check.ps1)

```
# Ask the user for input
$str = Read-Host "Enter string"

# Reverse the string by converting to character array
$array = $str.ToCharArray()
[array]::Reverse($array)
$rev_str = -join $array

# Check if they match
if ($str -eq $rev_str) {
    Write-Host "It is a palindrome."
} else {
    Write-Host "It is NOT a palindrome."
}
```

How to Run It:

1. Save the code above into a file named **check.ps1**.
2. Open Windows PowerShell.
3. If scripts are disabled on your computer, unblock them by running this command once:
`Set-ExecutionPolicy RemoteSigned -Scope CurrentUser`
4. Navigate to the folder where you saved the file and execute it by running:
`./check.ps1`
5. Type your string (e.g., `gfg`) and press Enter.
